

Slide 2:

- Don't worry about the plateau
- Need on a one sentence summary of what genomic selection is.

Slide 4:

- May not want to disparage cattle auctions
- I think you mean "industry average" not "herd average"
- "No one is thinking" other than the animal scientists people. Specify that you mean economists.

Background:

- More bolded words
- Scott: "how do they exactly get a DNA sample"
- Say "age of release," instead of "age at first proof"
- Joe: "expanded supply of animals, how?" (asked this before you got to the slide.
- Get a more recent paper about brand loyalty
- Where is Rosen for the superstar concept??
- Catalina: "how expensive is the genomic test?"
 - Try to look people in the eye when addressing questions
- Andy: "two sets of costs: people breeding bulls, and cattle farmers search costs have gone up?"
 - Getting lots of questions about the cost of genotyping, so may need to look into this more.
 - Andy: "Clarify this on the slide"
- Andy: "Describe the farmer's match process. How does the choice set work?"
 - Put up a sire summary proof.
 - Explain that it has genetic traits and also lineage traits.
 - Practice explaining how the selection process works at the dairy farm level:
 - Cite literature
- Sarah: "Intuition about inbreeding increases with genomic testing. If the supply is expanding shouldn't that be decreasing inbreeding?"
 - Explain what the effective population means
- Scott: "what proportion of dairy bulls are used in the US"
- Bruce: "explain how many offspring results from one bull."
- Bruce: "Distinguish between number of dairy animals."
 - Don't get too sidetracked on these questions
- Rosen wasn't about dairy herds, you don't need to bring it up.
- Take out the "foreign" line
- Need a slide just explaining the formula for genetic change.
 - Put it in the background where you explain the impact of genomics
- You should explain the negative impact of inbreeding rates in the beginning of the presentation
- Maria K: "did the supersires exist prior to GS"
- Marin: "Should we be worried about the fact that the flow is not going down?"

- Is the bull population growing indefinitely?
- Farzana: "how is a founder defined"
- Bruce: "do you have the difference in price before and after the introduction of GS?"
 - Need to be able to give a guess of how much the price has increased.\
 - Cite the literature
- Bruce: "Do you price semen so high that you have to throw it away?"
- Marin: "What were the constraints that prevented your control cows from being discovered."
 - This is (sort of) a question about pre-trends. Why didnt these control sires get picked?
 - Dont bring up the going back too far thing (not relevant).
- I'm now more convinced that you need to condense all of these assumptions into one slide.
- Some of this is just basic econometrics, no need to go over it.
- Dont use the word "progeny" EVER
- The fact that it shows up only in 2012 is a result of the biological lag.
 - They made decisions in 2010 that impacted the cohort in 2012
- Make sure you keep looking for questions.
- Sarah: "put the outcome on the slide"
 - The economic damage should be on the results slide.
- Scott: "bring your audience along about why you should care about inbreeding"
- Sarah: "are these cumulative changes?"
- Catalina: "Should the industry regulate this?"
- Joe: "why is inbreeding an externality"
 - Policy recommendation:
- Scott: "Monocultural agriculture is a good comparison."
- Contextualize the decrease in revenue

Strategic in your introduction of the context.

Why is inbreeding bad?

How is the outcome being calculated.

Put in more papers about brand loyalty (more recent ones).

Second slide:

- Example of how inbreeding in agriculture hurts productivity
 - That one dairy bull
 - The corn blight of 1970
- This is the costs of inbreeding in dairy.
- Inbreeding = the extent to which the genetic network is more connected

Third slide:

- This is what's happening in dairy.
 - Genomic selection: it increased the pace at which you can find new genetics.
 - This was supposed to make other less popular genetics easier to find.
- This is an externality because firms don't directly pay the cost of inbreeding
- But why?

Fourth slide:

- Research question
- Put the economic damages in terms of the economic benefit of higher TPI.

Methodological approach:

-
